# VITTIQO

YOUR MONEY. YOUR LANGUAGE. YOUR INTELLIGENCE.

## Multilingual AI-powered personal finance assistant

A practical voice-first way to record expenses, understand spending and manage budgets.

### THE PROBLEM

Everyday expense tracking can become tedious when people must enter each transaction, categorise spending and interpret financial activity. Text-first workflows can also be inconvenient for people who are more comfortable speaking or interacting in a familiar Indian language.

### THE SOLUTION

Vittiqo combines everyday expense management with multilingual speech interaction and AI-assisted financial insights. Users can add expenses manually or describe them naturally by voice. The app transcribes speech, extracts transaction details and presents the result for review before saving.

### HOW IT WORKS

- **Speak or type.** Enter an expense naturally or use the manual form.
- **Transcribe.** Gnani Prisma converts voice input into text.
- **Extract and review.** Gemini identifies amount, category and date; the user confirms the details.
- **Track and ask.** Appwrite stores records; dashboards, budgets, reports and FinBot help users understand spending.
- **Listen.** Gnani Timbre turns FinBot responses into speech.

### CORE CAPABILITIES

- **Multilingual voice interaction:** Gnani lists support for 10+ Indian languages for Prisma and 10+ Indic languages for Timbre; app-level availability depends on model configuration and validation.
- **AI expense extraction:** Natural-language descriptions are converted into structured transaction details.
- **FinBot assistant:** Contextual responses about spending and recorded financial activity.
- **Spoken responses:** Text-to-speech playback for AI-generated advice.
- **Money management:** Monthly budgets, category limits, transaction history and reports.

### TECHNOLOGY

Gnani Prisma (speech-to-text) · Gnani Timbre (text-to-speech) · Google Gemini (expense extraction and financial-assistant responses) · Appwrite (authentication, database, storage and server-side functions) · React Native, Expo and TypeScript.

### WHO IT IS FOR

Individuals who want a clearer picture of everyday spending, especially people who are more comfortable operating or speaking in a familiar Indian language. Students and other users can also use manual entry, budgets and reports.

### WHAT MAKES IT DIFFERENT

Vittiqo brings multilingual voice access together with user-confirmed AI expense extraction, budgeting and spoken financial guidance. It aims to make everyday money management more approachable for people who prefer interacting in a familiar Indian language rather than relying only on text-heavy workflows.

### PROJECT & DEVELOPMENT

**Repository:** https://github.com/Mysticlynxz/finance-tracker-app

**Contribution:** Product direction, feature requirements, integration decisions, testing, debugging and release validation. AI-assisted development tools supported code drafting and troubleshooting; the application flows and integrations were reviewed and tested.
